**Democratic Republic of the Congo:
Cursed by resources, but elite circulation
can break the value extraction cycle**

The Democratic Republic of the Congo (DRC) is certainly the perfect illustration of what economists call the “resource curse”. As one of the richest countries in the world in terms of natural resources (diamonds, gold, copper, cobalt, coltan, and many more), the DRC is frequently ranked among the most lagging countries in terms of human development. The EQx2023 provides a quite comprehensive account of the drivers of this deeply embedded “curse” which has been augmented by the dreadful role played by the DRC elites in this ongoing tragedy.

One can safely say that since its independence in 1960, the DRC has never been able to escape from the clutches of one of the fiercest predatory elites in human contemporary history. After the tragicomic reign of Mobutu Sese Seko (1965-1997), one of the major representatives of neopatrimonialistic autocrats, the country fell under the control of the Kabila dynasty as a result of a sequence of civil conflicts, often fueled by neighboring countries (in particular, Rwanda), determined to exploit the immense Congolese reserves of several strategic metals via complicit local militias (such as the M23, backed by Rwanda, which is still active in Northern Kivu, Eastern DRC). However, a shallow hope for inclusive elite circulation has been emerging since current President Félix Tshisekedi broke his alliance with former dictator Joseph Kabila in 2020. Tshisekedi is now heading a new coalition openly running on the basis of socioeconomic progress and anti-corruption initiatives (which is not without risks as the 2023 presidential election draws ever closer).

While the early positive macroeconomic impact of these initiatives has been recently outlined by the IMF, the structural mechanisms driving the Congolese tragedy since independence remain in place. The size of the country (the second largest in Africa) and the fragility of the state at all levels (including at the provincial level) and in all aspects (military forces, fiscal capacity, etc) make it almost impossible to oust the international and local predatory players in such a resource-rich and institutionally-fragile nation, at least in the short run. The EQx2023 ranking of the DRC at # 130 out of the 151 countries assessed reflects the current political economy of a country where local extractive elites and their international allies still dominate the game. The EQx paints a quite accurate picture of these extractive elites at all levels. The Political Power and Political Value rankings (Index Areas (i) and (iii), rank # 146 in both areas) clearly illustrate the political roots of the elite and the consequences of their agency. They also highlight how the case of the DRC is one of the most dramatic of our time, and in principle should receive much more attention as well as firm action from the international community.

The more disaggregated Indicators of the EQx2023 provide us with a more detailed x-ray of the Congolese “resource curse”. Both the level 3 Pillars and the level 4 Indicators align with field observations. The very significant importance of State Capture, Regulatory Capture and Human Capture, the three pillars that make up the Political Power Index area, show the damage caused by Congolese elite agency (with the following respective rankings; # 143, # 145, and # 137). This potential for extraction is realized through very poor Political Value (Pillar (iii) at level 3): low investment in education and health, even though the COVID-19 experience in DRC has not been among the worst in the world (similar to many other Sub-Saharan African countries for a variety of reasons that are not expounded on here). The rankings for Indicators such as Life expectancy (for both males and females; LEM/LEW, iii.7, rank # 143 and rank # 140, respectively) or schooling time are indeed extremely unfavorable.

The dataset gathered for the pillars in the Economic Power index area are equally relevant. It clearly reflects the extreme lack of sectoral diversification, the overwhelming dominance of the extractive industries, and the absence of a sound industrial policy and any real support for innovation. Indeed, the Indicator *Natural resources rents as % of GDP* (NRR, iii.9, rank # 135), shows that the DRC is clearly one of the most resource-dependent countries in the world. The high ranking for Firm Dominance (rank # 12), is here completely irrelevant, based as it is on a single Indicator and pointing to another issue: the inability to collect reliable data for the DRC. While the figure for *SMEs per 1,000 people* (SME, ii.5) is also unavailable, it would in any case have been very small in terms of the % of GDP compared to that of the big mining companies depleting the natural resources of the country. The huge endowments of natural capital that the country enjoys should have been exploited to develop agriculture, the food industry and agribusinesses, to reduce malnutrition and poverty in the country (see, for example, the ranking for the *Global Food Security Index*, FSQ, iii.7, rank # 109).

63

The lack of a redistribution of political rights and the confiscation of resource rents by political elites and their external allies (multinationals and foreign states) have considerably retarded social and societal progress in DRC, a fact that is evidenced by almost all of the EQx Indicators. As long as the DRC remains weak and without the capacity or will to enforce change, there is no way it can manage its developmental mission effectively. The key challenge for the DRC is to assure maximal economic returns from its huge natural wealth, a task that still looks to be dependent on breaking free from the vicious circle of Value Extraction as soon as possible.
